Ground Handling.

1-1.

1-2.

1-4

1-5. The Ground Handling section, Section III contains information and dilustrations as to the handling of sircraft during ground operations. This information includes instructions on towing, parking, meering, jacking and holeting the aircraft.

1-6. Access Openings:

HALL OF FAME

1.7. The following listed illustrations will locate and identify all access panels and openings on the apper and lower surfaces of the aircraft fuscings and wings.

1-8. Upper and Lower Fusalage and Wing Access Panals and Openings.

Aircraft External Drain and Vent Locations. (See Figure 1-2.) 1-10. This illustration will locate and identify all drains and vents about the lower fuselage, wing and macalle sections of the aircraft. 1-11. Runway/Taxiway Strength Capabilities.

1-12. In order to determine if this aircraft can taxi on existing taxiways

2.4.19%2.1972

or land on existing runways, the following data is provided :

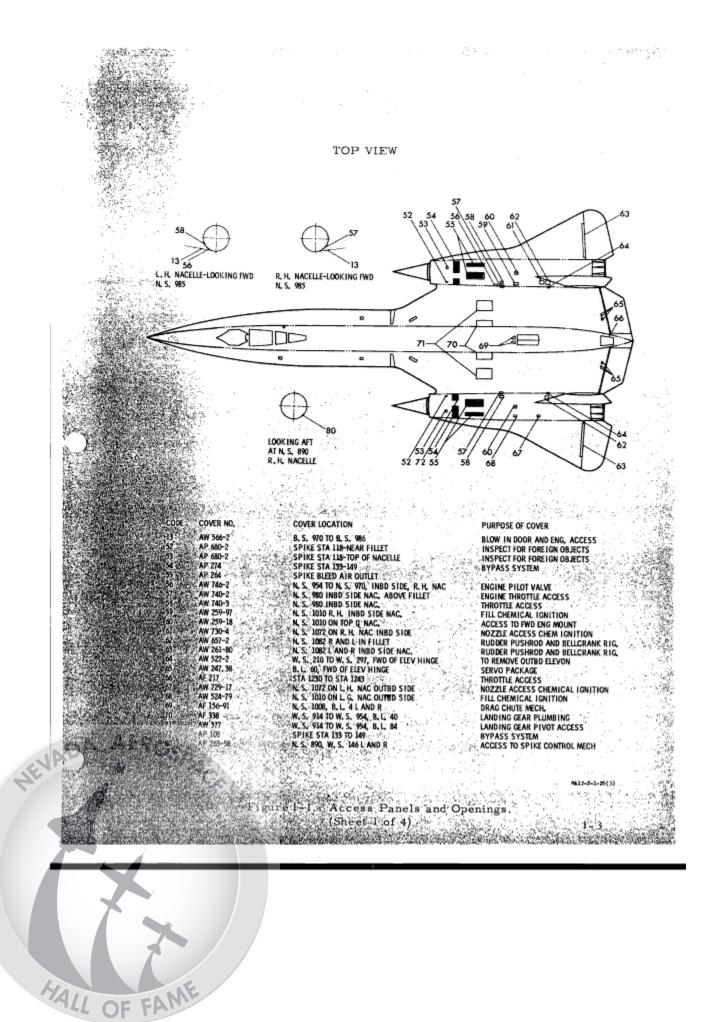

a. MLG Tire Foot Print 56 inches.

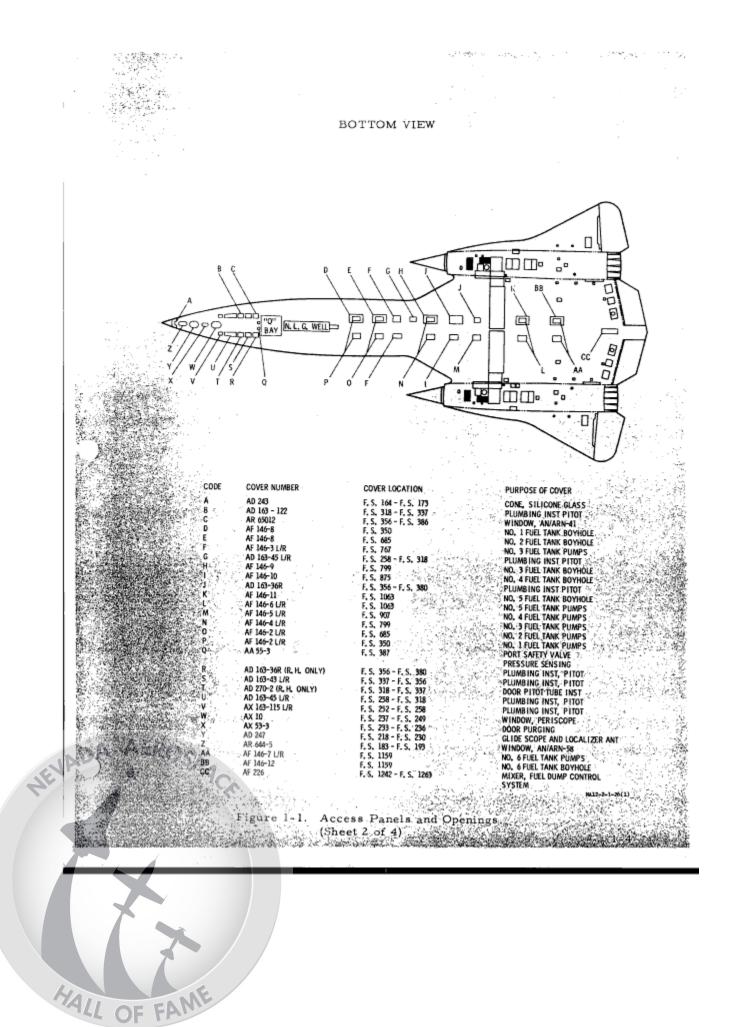

b. Tire Pressure 290 psig (GN2) initial.

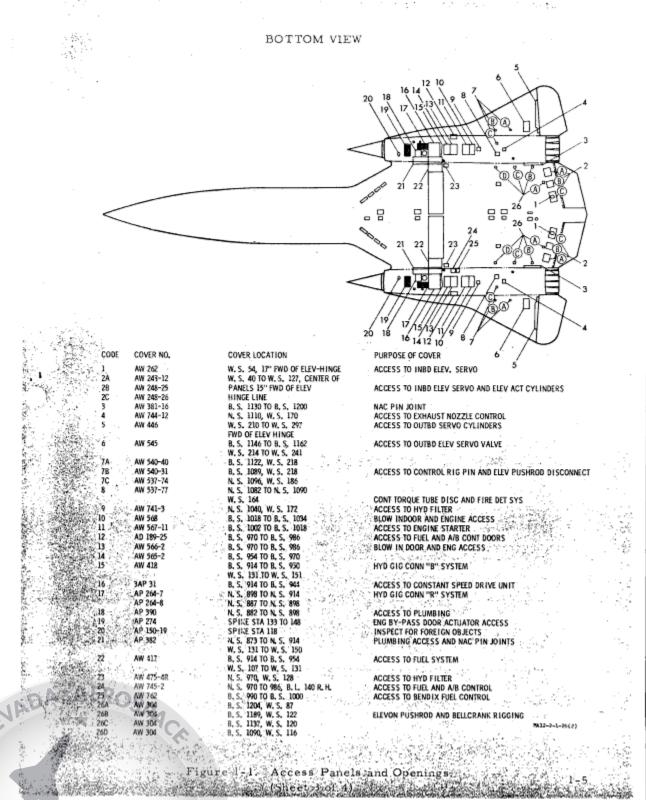

c. MLG Load per tire 16, 400 lbs.

d. NLG Load per tire 9,250 lbs.

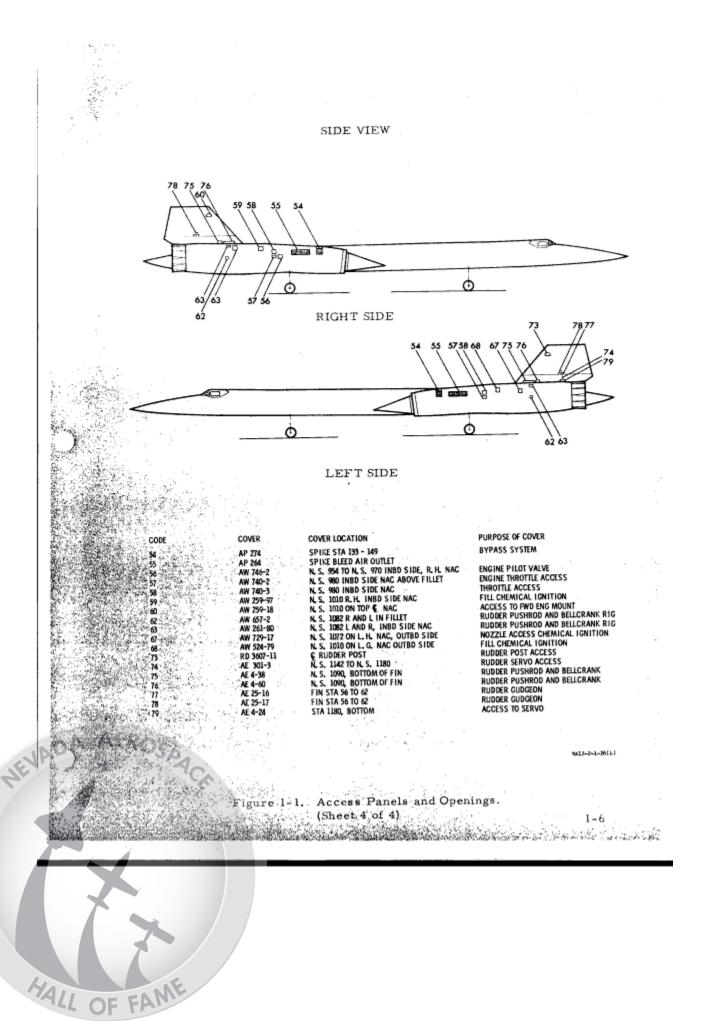

e. UCI Index, close to 300.

HALL OF FAME

2-3. Grounding Aircraft. (See Figure 2-1.)

2-4. In order to guard against the ever present dangers of static electricity, all aircraft must be effectively grounded with a low resistent ground wire at all times and should be removed only when it is necessary to move the aircraft. Prior to applying all external electrical power, each individual power unit should be independently grounded.

2-5. Ground Run-Up Danger Areas. (See Figure 2-2.)

2-6. Ground operation of the engine can result in damage to equipment and injury to personnel if recommended safety precautions are not observed.

2-7. Movable Surface Hazards. (See Figure 2-3.)

2-8. During ground operation and maintenance of the aircraft it is necessary to operate all movable surfaces. In all cases, personnel and equipment must be clear of the area involved before operation of any movable surfaces.

2-9. Internal Ground Safety Devices. (See Figure 2-4.)

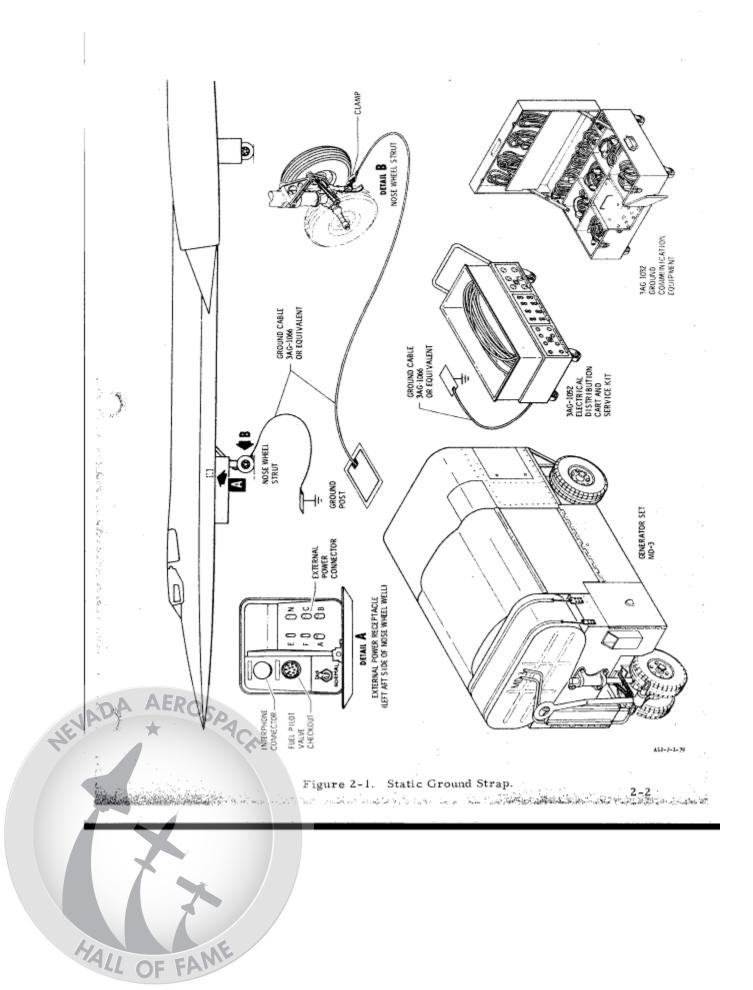

2-10. External Ground Safety Devices. (See Figure 2-5.)

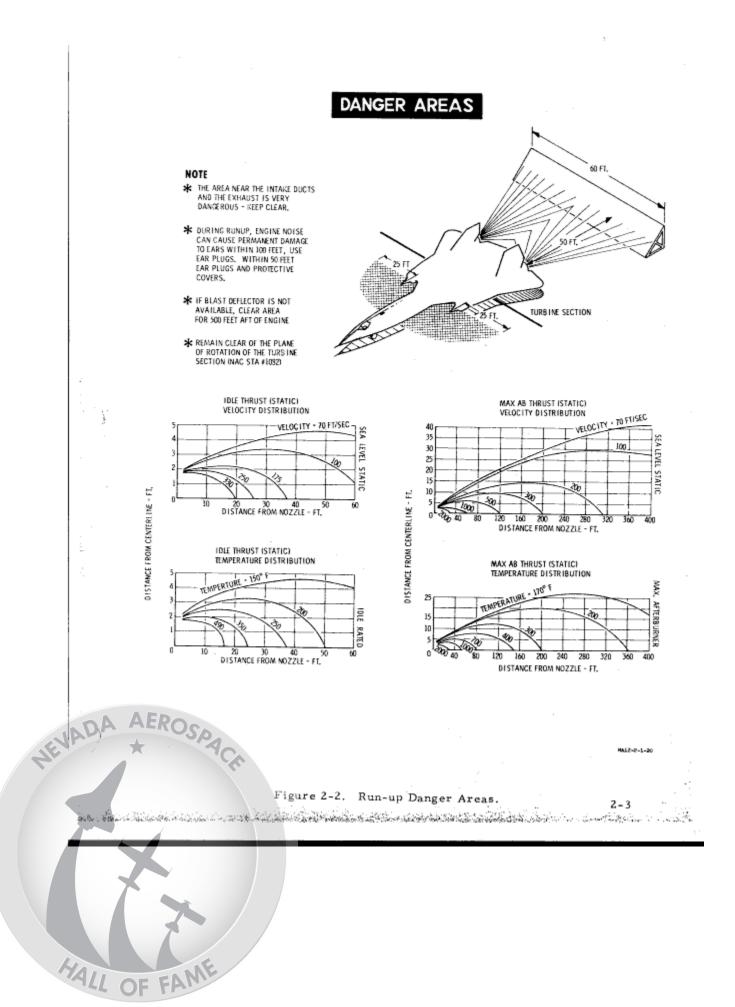

star blar Storage

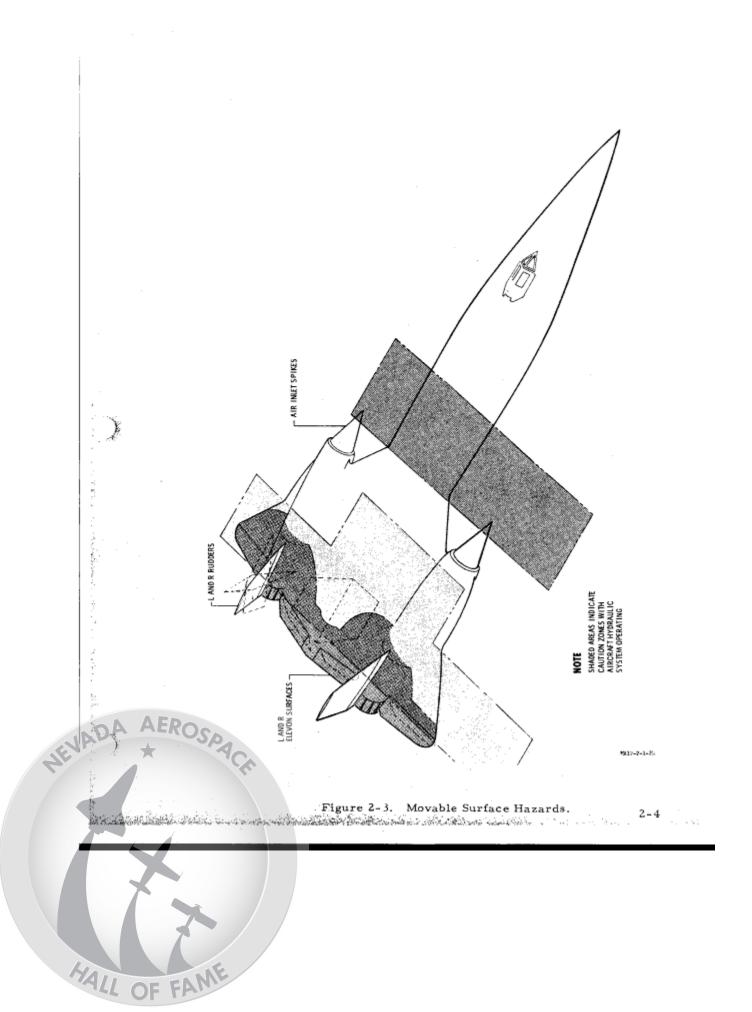

State Martin

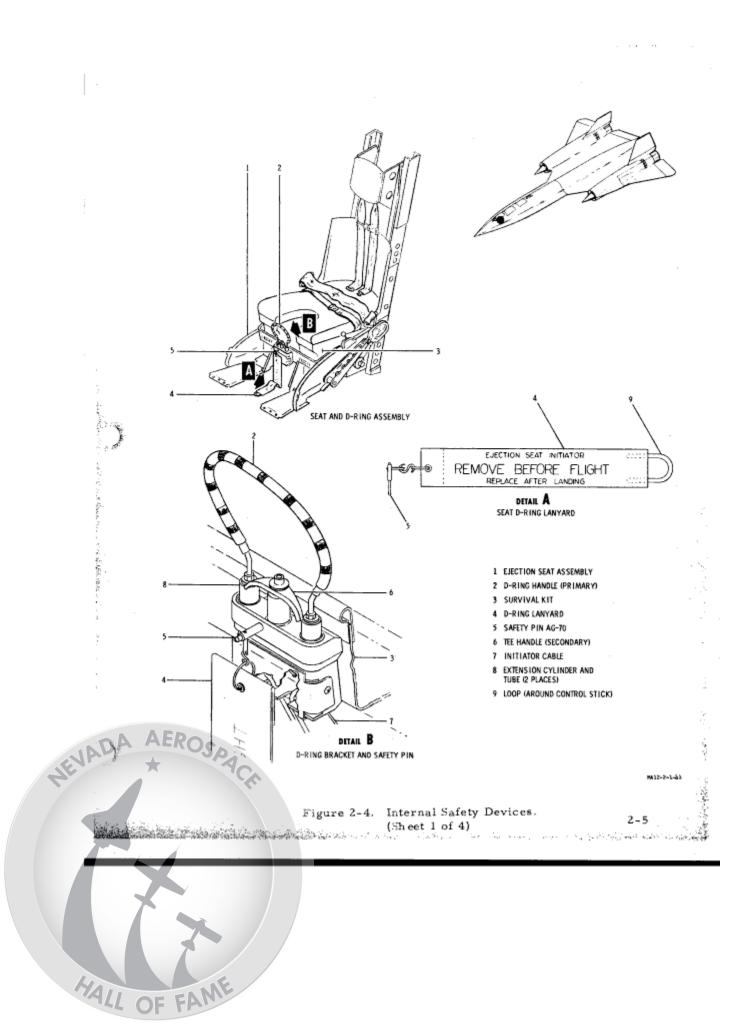

2-1

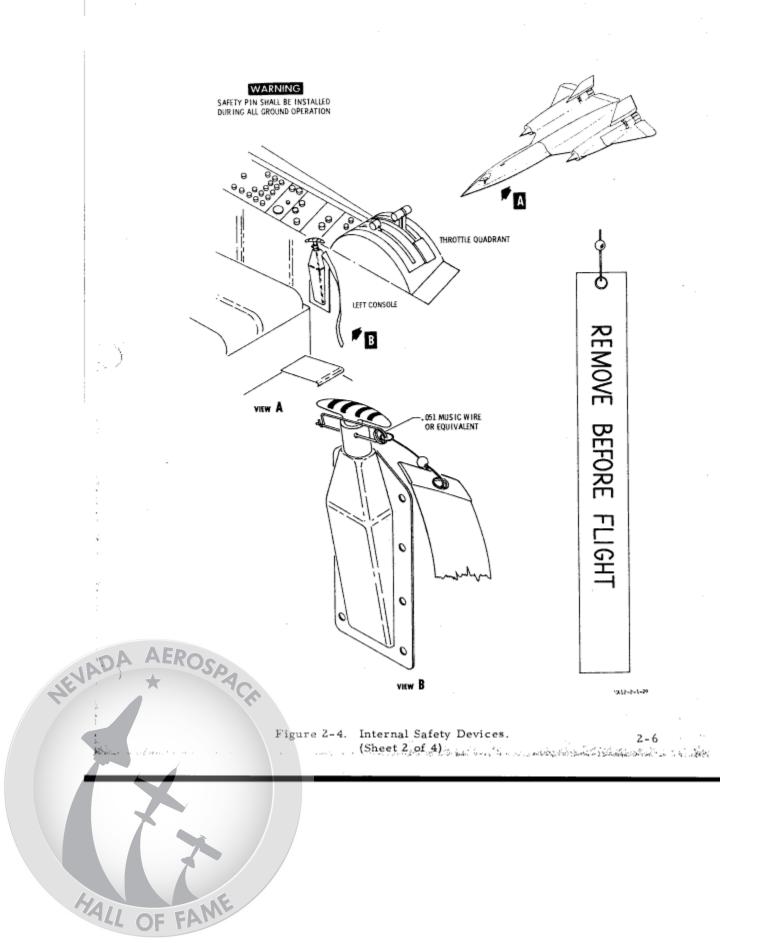

Nerth.

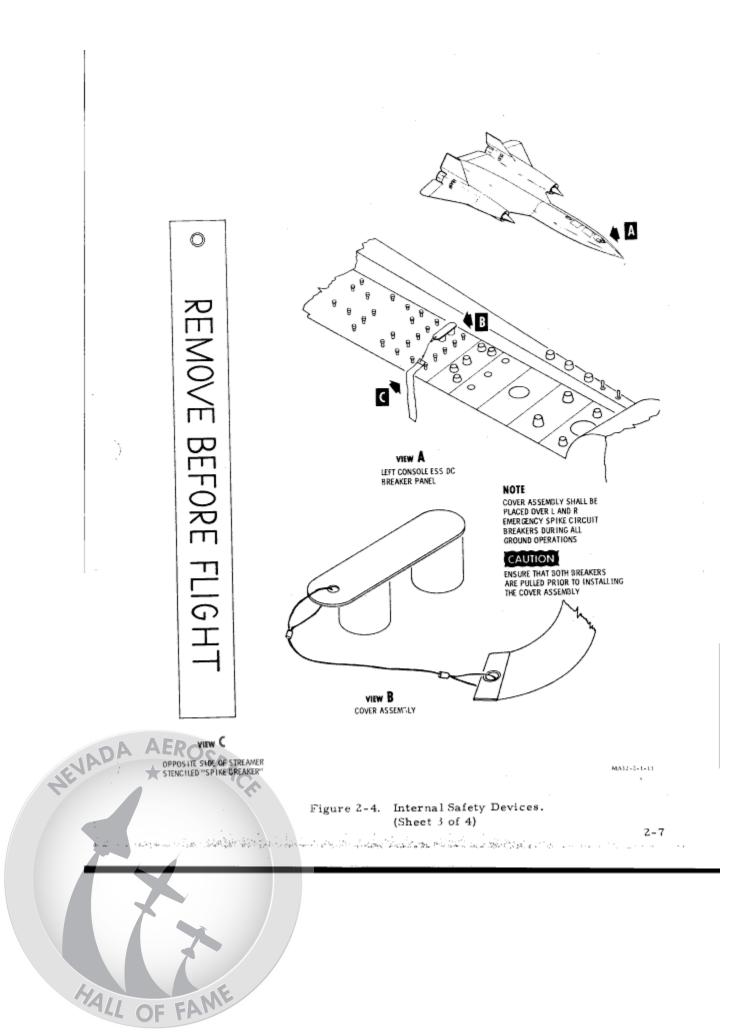

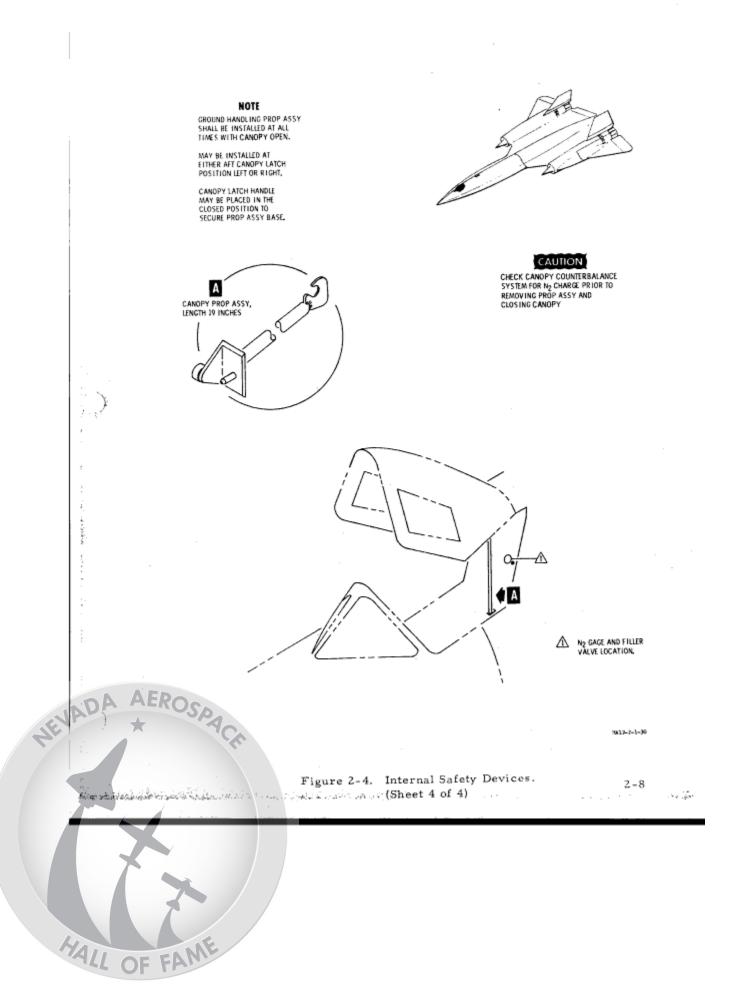

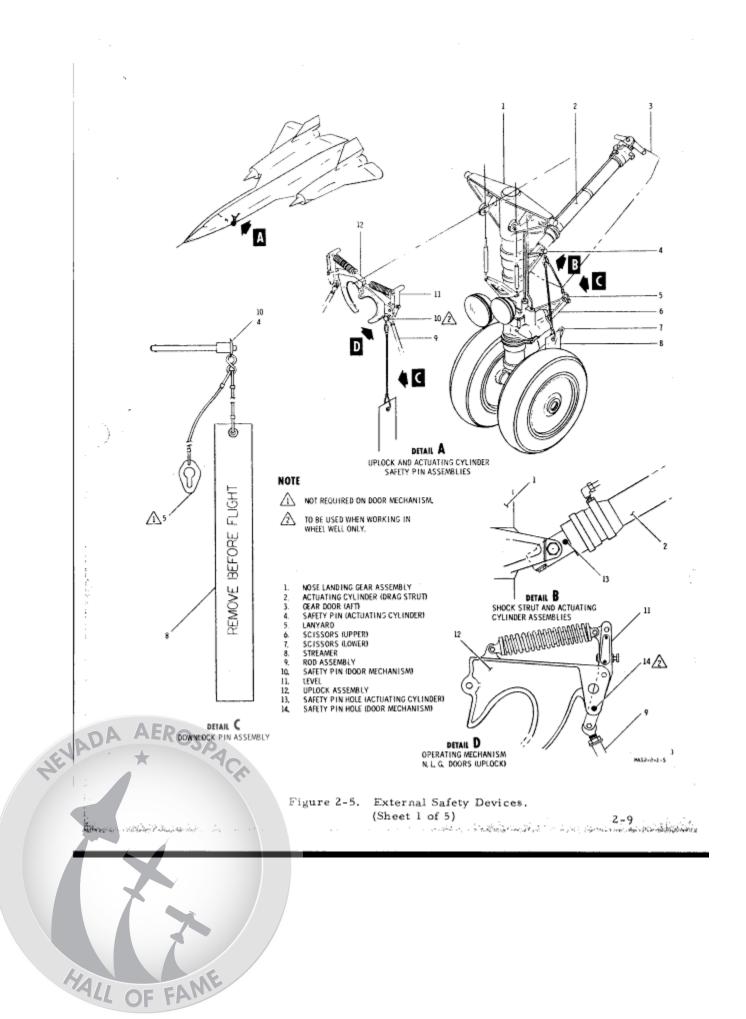

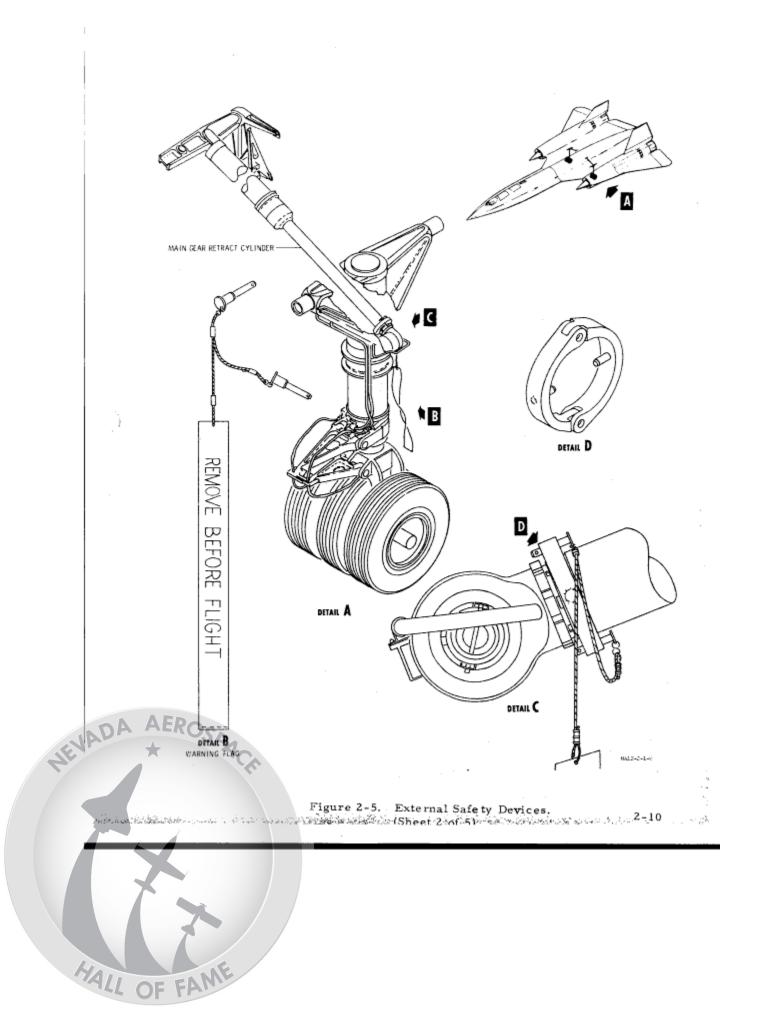

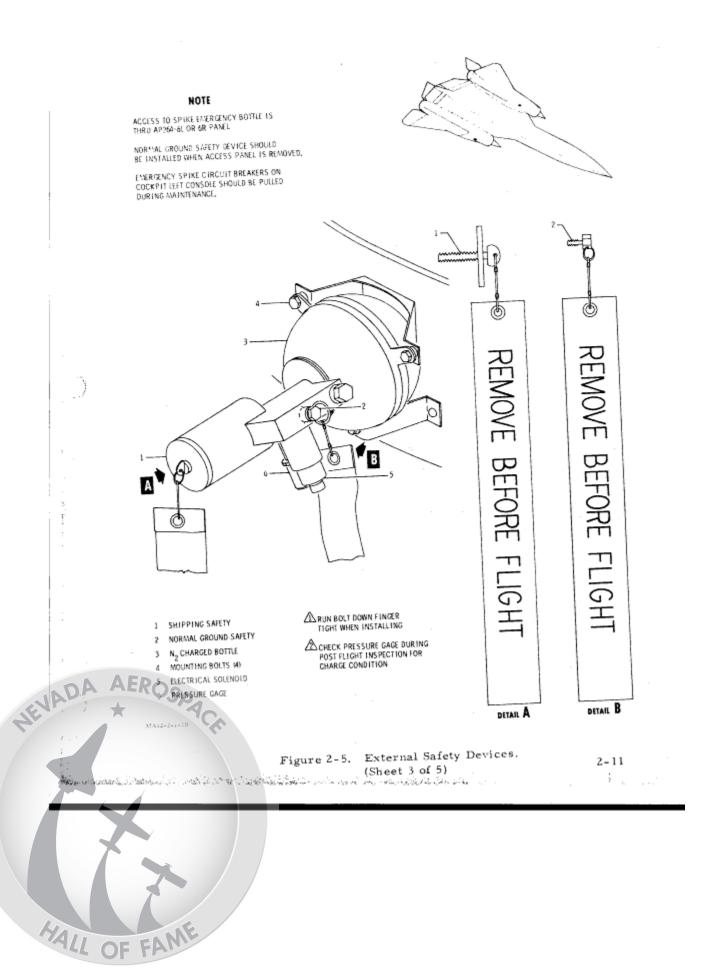

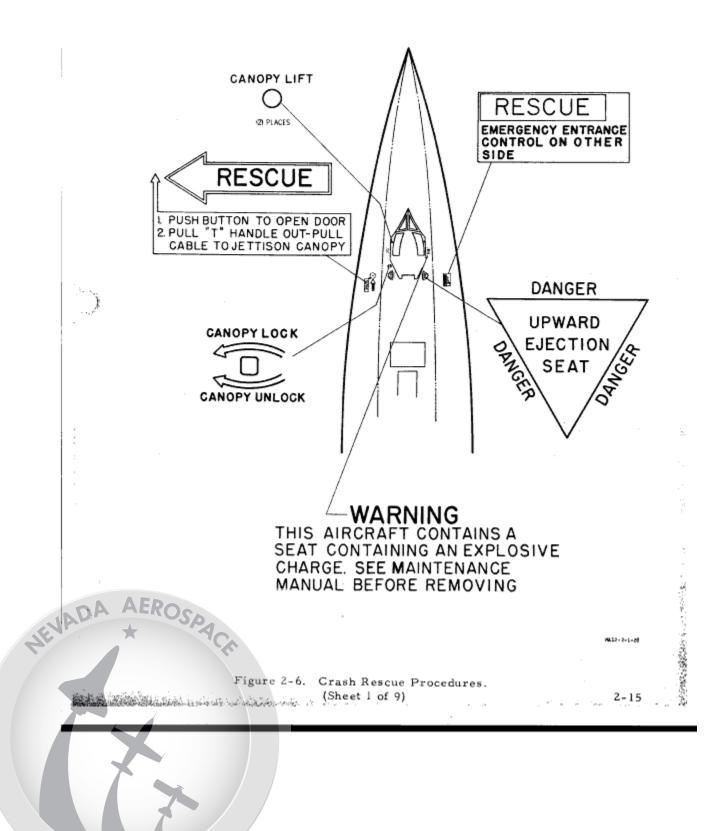

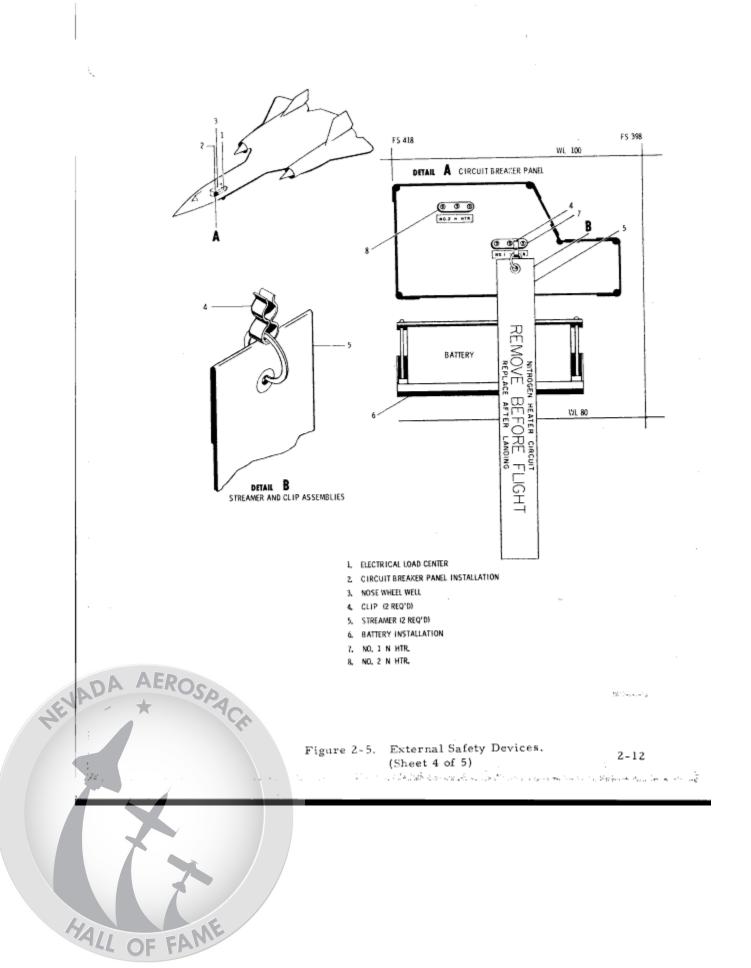

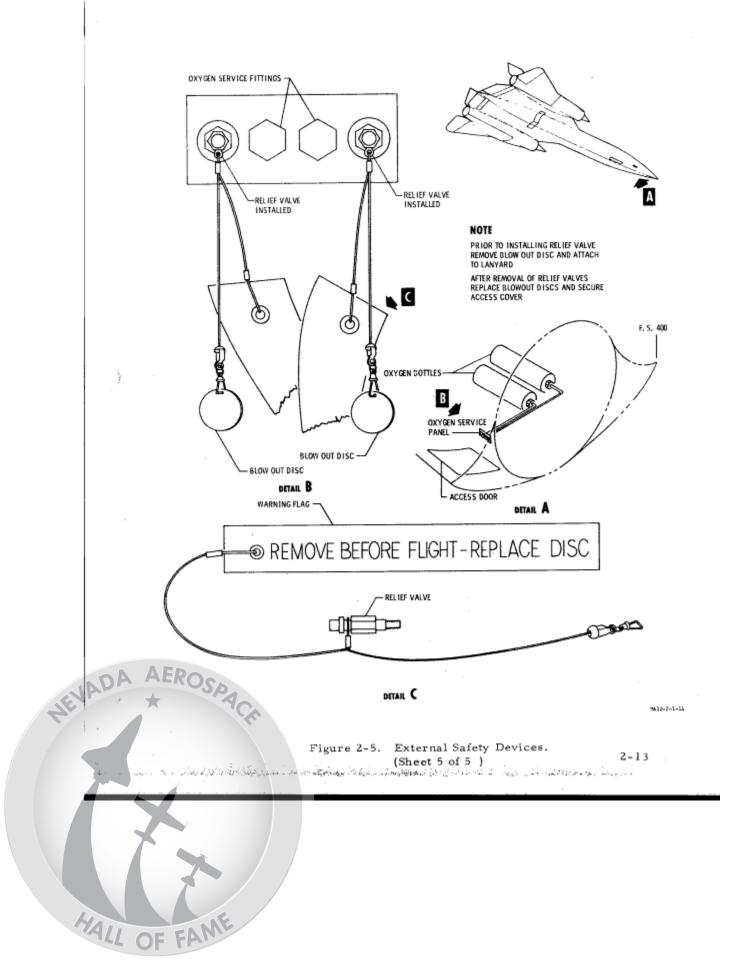

2-11. Crash Rescue Procedures.

2-12. The safety precautions listed in the following paragraphs and illustrations shall be strictly adhered to to prevent injury to the personnel involved.

Note

The following information is intended for crash site use to assist rescue crews in determining the most practical and safest way to assist the pilot in evacuating the aircraft.

CAUTION

All ground resceu crews shall wear asbestos suits and gloves due to the possibility of encountering hot aircraft structure resulting from high speed flights.

2-13. Crash Rescue Markings. (See Figure 2-6, Sheet 1.)

2-14. Crash Rescue Procedures.

HALL OF FAME

2-15. Removal of the canopy by the external jettison method is the primary means of gaining immediate access to the cockpit. (See Figure 2-6, Sheet 2.)

2-16. Conditions existing during the emergency could possibly dictate the method required to remove the canopy. To remove the canopy employing the manual opening mechanism, see Figure 2-6. Sheets 3 and 4.

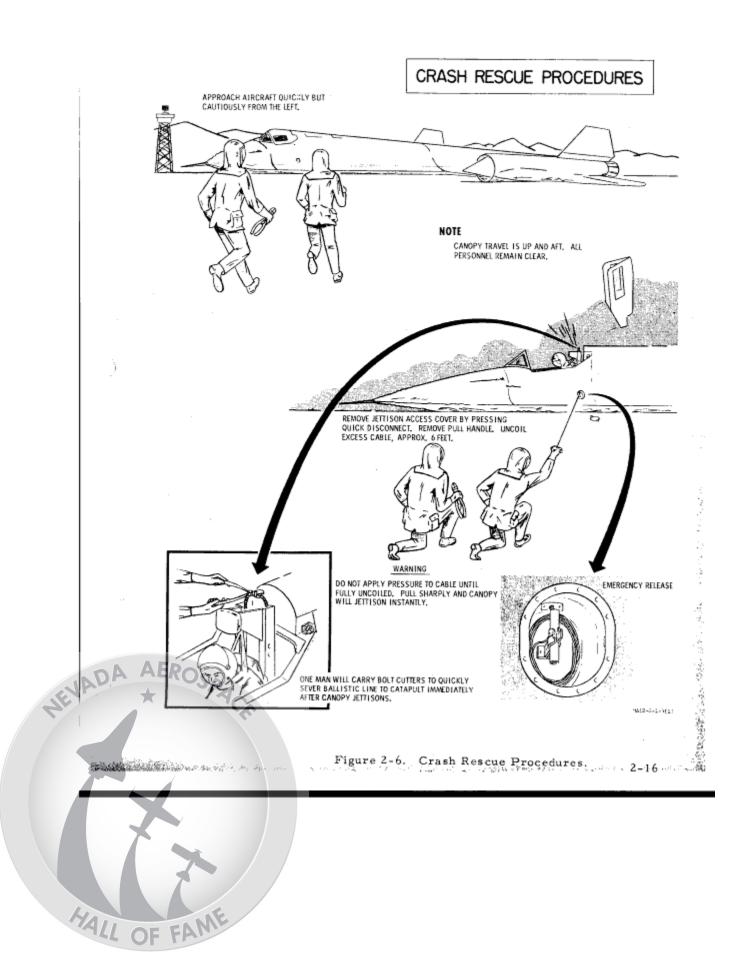

WARNING

A hazardous condition can exist regardless of which

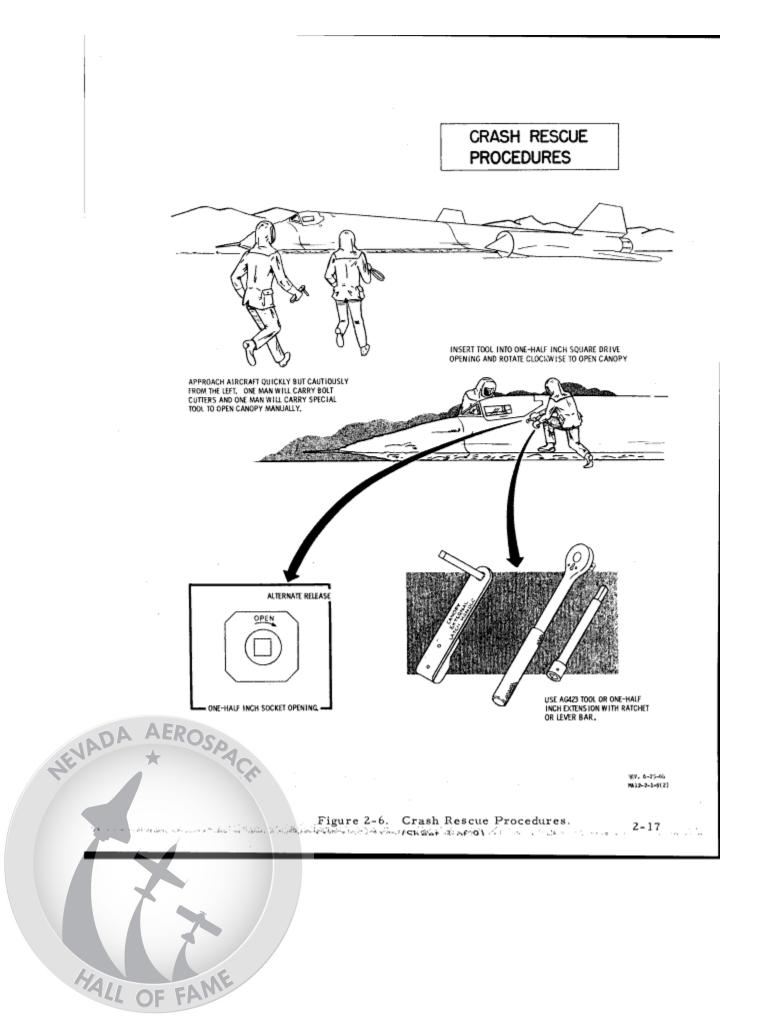

method is used to open and remove the canopy. It

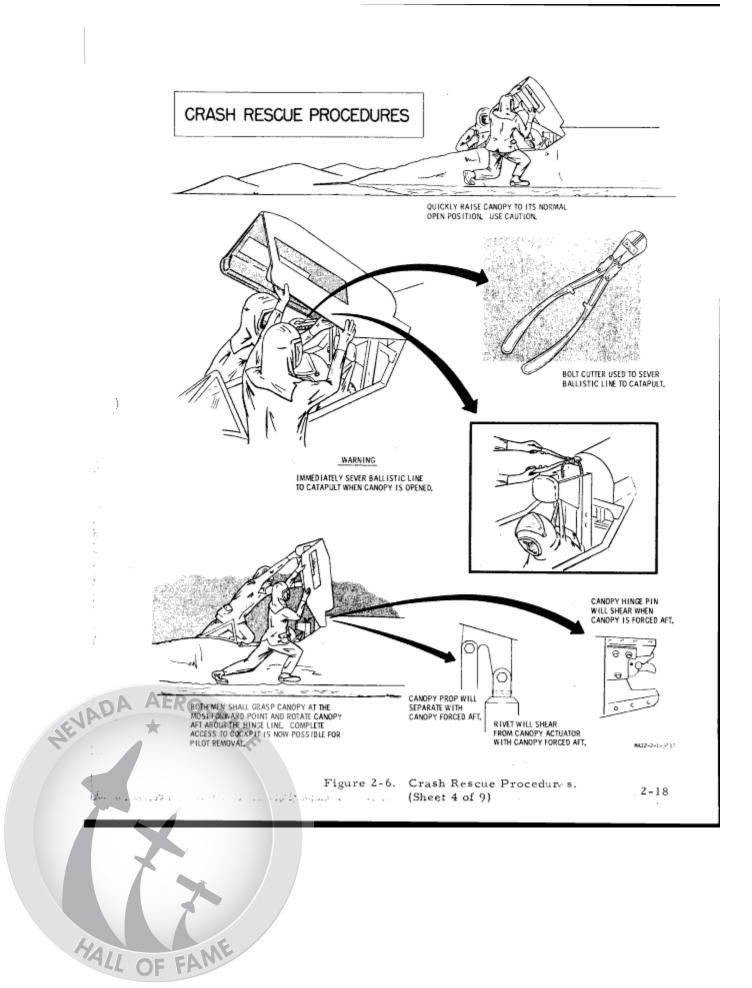

is imperative that the ballistic line to the catapult

2.14

(1,2,2)

be severed immediately upon gaining access to the cockpit.

2-17. Forcible Entry. (See Figure 2-6, Sheet 5.)

2-18. This information will be added when available.

2-19. Once access to the cockpit is possible rescue personnel can immediately begin with the pilot removal procedure. (See Figure 2-6, Sheet 6.)

CAUTION

Shut off normal oxygen supply immediately

upon access to the cockpit.

2-20. Procedures as shown in Figure 2-6. Sheet 6, represent the quickest and safest method of releasing the pilot from the arresting harness, emergency equipment, seat and subsequent removal from the cockpit.

2-21. Emergency Pressure Suit Handling. (See Figure 2-6, Sheets 7 & 8.)

2-22. The following sequence is recommended for normal removal of equipment:

- a. Boots
- b. Gloves
- c. Outer Garment
- d. Helmet
- e. Suit

HALL

OF FAME

Note

Remove helmet by operating release and lift

clear, severing the two oxygen hoses from

2-19

To be added at a later date.

÷,

Ż

2-20

suit to helmet. If time permits, open outer garmet front zipper and open main suit zipper for access to oxygen disconnects inside pressure suit.

WARNING

If crew is injured, open face plate only until a medical doctor arives.

2-23. Engine Shutdown Procedure. (See Figure 2-6, Sheet 9.)

2-24. Should the emergency be such that the engines are still developing power, the procedures as shown in Figure 2-6. Sheet 9, will provide the quickest and safest means of stopping the engines, shutting off the oxygen supply and deactivating the electrical busses.

2-25. Handling of TEB, Chemical Ignition Fuel During Crash Rescue Procedures.

141010

the first of the second state in the

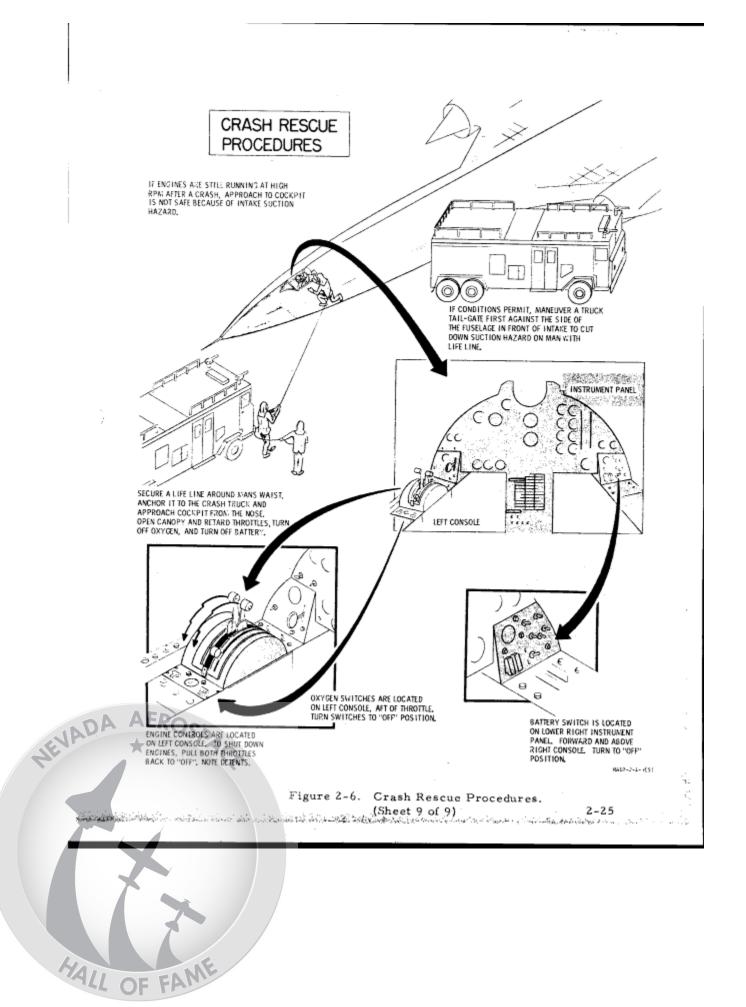

HALL OF FAME

WARNING

Procedures are established in the Flight Manual which require the pilot to dump the chemical fuel durng an emergency. If this

2-24

and a second the second to be the the second and the

is not possible the condition could become serious. There are no quick opening access panels near the chemical fuel tank and lines. Should a TEB fire be the primary concern, the immediate area about the tank location may be flooded with water or CO₂ until it can be determined that a hazard no longer exists.

2-26. Damage Prevention.

JEVADA

HALL OF FAME

2-27. The following information consists of data and recommended procedures for the extinguishing of fires by aircraft maintenance personnel.

2-28. Fire and Explosion Hazards.

have the second second and the second se

2-29. Maintenance personnel should be familiar with the fire and explosion hazards of this aircraft so that precautionary measures can be taken. Fires and explosions generally occur when a flammable substance, oxygen (air) and a source of ignition are brought together. The primary flammable substances in this aircraft are fuel, hydraulic fluid, lubricating oil and greases and pyrophoric fluid used in the engine ignition system.

Pure oxygen can cause a fine or explosion simply by contact with these substances. Common sources of ignition are electric arcs, flame and hot surfaces. The following conditions are particulary hazardous.

a. The mixture of fuel vapor and air in the fuel tanks and vent system is explosive when ignited. However, PFl Fuel is not volatile as other jet type fuels.

Fuel, hydraulic fluid or engine oil spraying in a fine mist
 will explode or flash when ignited.

c. Fires or explosions can be produced spontaneously when flammable substances contact oxygen of high purity.

d. The pyropheric fluid (triethylborane) used in the engine ignition system will ignite immediately upon exposure to air.

2-30. Fire Fighting Precautions.

8.

ь.

SARAH SHE SA

HALL

OF FAME

2-31. Maintenance personnel should be alert for possible aircraft ground fires and be prepared to act rapidly and affectively if a fire is discovered. It is recommended that maintenance personnel become familiar with the /following types of fire hazards and precautions.

How access is gained quickly to apply on extinguishing agent.

「おいてい」

÷

How to notify professional fire fighting personnal immediately.

2-27

ARAMAN AL MILLER PROPERTY AND A REAL ARAM AND A LAND

c. The agents which are recommended for different kinds of fires and how to operate the extinguishing equipment, eg. area water, water fog, CO₂, DCP or chemical and mechanical foam.

d. Chemical and mechanical foam agents leave deposits; if possible these agents should be removed by flushing thoroughly with water, no other action is required.

WARNING

Ansul Plus Fifty B Dry Chemical Powder should not be used except in an emergency. If used, all traces of residue shall be completely removed by spraying with PF-1 Fuel, flushing thoroughly with running water and wiping as dry as possible. The following agents are <u>not</u> approved as fire extinguishing agents. Inadvertent use must be reported to Engineering:

39

(1) Ansul Met-L-X Dry Chemical

(2) Chlorobromomethane (CBM)

JADA

HALL OF FAME

(3) Soda and Acid type extinguishers

Z-28

the second second second for the the second second

e. The availability and serviceability of extinguishing equipment during ground operations.

2-32. General procedures to be carried out when a fire is discovered.

Apply proper agent to fire as soon as possible.

b. For engine fires, follow procedures as outlined on Figure 2-7.

c. Position yourself upwind and do not stand in flammable liquids when applying agents.

d. Move ground support equipment away so that fire fighting equipment will not be hampered.

e. When available agent is expended and/or the fire is out of control, evacuate the area because of the danger of explosion.

2-33. Oxygen Fires.

HALL

OF FAME

2-34. Oxygen can cause spontaneous ignition and explosions when it comes in contact with flammable substances. A fire aided by oxygen will burn intensly and spread rapidly. CO₂ or DCP (dry chemical powder) should be applied to slow the progress of these fires. However, effective extinguishing of oxygen-supplied fires generally require foam. Sources of 100 per cent oxygen in the aircraft are the bottles in the nose wheel or chine area.

2-29

als a

Constant and the set of the set of

"我的话题"

2-35. Engine Fires. (See Figure 2-7.)

2-36. An engine or nacelle fire may not be indicated by the engine fire and/or overheat system. Ground personnel should be alert for this condition during engine ground operation.

2-37. Chemical Ignition Fuel (TEB) Fires.

2-38. A fire will occur when triethylborane (TEB) is exposed to air as a result of spills, line rupture or leaks. To control TEB fires, the fire fighter shall attempt to confine the fire by blanketing the burning liquid with foam or water spray.

WARNING

Carbon tetrachloride and halogenated hydrocarbons react with TEB and should never be used to combat fires.

Note

Tests have indicated that TEB will ignite when exposed to air at all temperatures to be encountered during handling.

2-39. Hot Aircraft Wheels.

2-40. When an aircraft is subject to excessive braking action, especially an aborted take-off or drag chute failure, the following procedures should be

A rigidly adhered to:

FIRE FIGHTING PRECAUTIONS

WARNING PRECAUTIONS LISTED BELOW SHALL BE OBSERVED, IN ORDER TO AVOID SERIOUS INJURY TO INVOLVED PERSONAL.

5

6

FIGHTFIRE, WHEN POSSIBLE FROM UP-WIND SIDE . 1

- DO NOT STAND IN FLAMMABLE LIQUIDS. 2
- DO NOT PUT YOURSELF IN POSITION WHERE YOU CAN BE 3 TRAPPED BY FIRE OR FUMES.
- USE CAUTION TO AVOID SLIPPING ON WET SURFACES đ

CLEANING PROCEDURE

3

4

AFTER FIRES ARE EXTINGUISHED REMOVE CHEMICAL POWDER FROM AFFECTED AREAS OF AIRCRAFT AS FOLLOWS:

- WIPE AFFECTED AREAS WITH CLEAN CLOTH. USE AIR BLAST TO CLEAN AREAS NOT READILY ACCESSIBLE TO CLOTH WIPING. 1
- WASH ALL AFFECTED AREAS THOROUGHLY. 2
- THIS WELL INCLUDE A THOROUGH ENGINE INSPECTION WHENEVER POWDER WAS INTRODUCED SO THAT IT PASSES THROUGH THE ENGINE.

USE DRY CHEMICAL POWDER OR CO2 AGENT IF AVAILABLE

IF CO2 OR OTHER APPROVED LIQUID EXTINGUISHED AGENTS ARE USED, USE EXTREME CARE THAT DIRECT BLAST OF COLD LIQUID OR GAS DOES NOT CONTACT HOT METAL SURFACES.

STRESS EXPLOSIONS CAN BE CAUSED WITH RESULTANT

RINSE AFFECTED AREAS WITH APPROVED ANTI-RUST

THOROUGHLY CLEAN AND INSPECT ALL ENGINE PARTS IN THE

AREA WHICH THE CHEMICAL AGENT HAS BEEN INTRODUCED.

SOLUTION AND RINSE WITH CLEAN WATER.

INJURY TO PERSONNEL

FIRE IN ENGINE AIR INLET DUCT

THESE FIRES USUALLY OCCUR DURING STARTING OR WHILE ENGINE 15 RUNNING. IN CASE OF FIRE PROCEED AS FOLLOWS:

1 THROTTLE - ADVANCE PART WAY TO MILITARY POWER.

NOTE

IF FIRE DOES NOT BLOW OUT OR PERSISTS, SHUT DOWN ENGINE AND FIGHT AS OIL FIRE.

- THROTTLE OFF 2
- EMERGENCY FUEL SHUT OFF SWITCH OFF (GUARD UP), 3 IALLOW 5 SECONDS FOR VALVE TO CLOSEL
- BATTERY SWITCH OFF. ۵
- 5 LEAVE COCK PIT AS SOON AS POSSIBLE.
- INTRODUCE DRY CHEMICAL POWDER OR CO, AGENT INTO ĥ THE ENGINE AIR INLET DUCT

IF FIRE OCCURS WHILE ENGINE ACCESS DOORS ARE OPEN IAS DURING INITIAL ENGINE RUNI, FIRE FIGHTING IS SIMPLIFIED. WHEN ENGINE ACCESS DOORS ARE CLOSED, ENTRY FOR THE EXTINGUISHING AGENT IS THROUGH THE LOWER "SUCK IN" DOORS AT THE ACCESSORY SECTION. IN CASE OF FIRE PROCEED AS FOLLOWS:

CHEMICAL IGNITION PURGE SWITCH - DUMP (SWITCH UP). 1

CAUTION

ACTUATE DUMP SWITCH IMMEDIATELY TO ENSURE HYDRAULIC PRESSURE AND POWER WILL BE AVAILABLE TO DUMP THE CIS TANK. POWER WILL BE REQUIRED FOR UP TO 10 SECONDS.

THROTTLE - OFF. 2

and the state of the

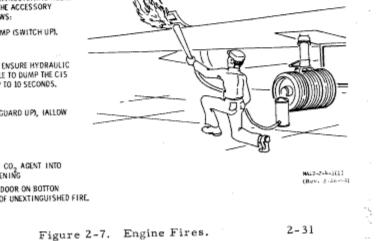

HALL OF FAME

JEVADA

- EMERGENCY FUEL SHUTOFF SWITCH-OFF (GUARD UP), (ALLOW 3 5 SECONDS FOR VALVE TO CLOSEI.
- BATTERY SWITCH OFF.
- MEAVE COCKPIT AS SOON AS POSSIBLE.
- INTRODUCE DRY CHEMICAL POWDER OR CO, AGENT INTO ACCESS BOOR OR "SUCK IN" DOOR OPENING

Ato

AS SOON AS PRACTICAL, DPEN ACCESS DOOR ON BOTTON OF FUSELAGE AND CHECK FOR EVIDENCE OF UNEXTINGUISHED FIRE.

(Sheet 1 of 2)

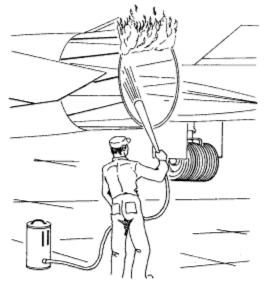

TAIL PIPE FIRES USUALLY RESULT FROM EXCESS FUEL COLLECTING IN THE AFTERBURNER SECTION AFTER SHUT-DOWN, OR DURING STARTING CYLCLES. IN CASE OF FIRE INTER GROUND START UNIT ENCAGED PROCEED AS FOLLOWS.

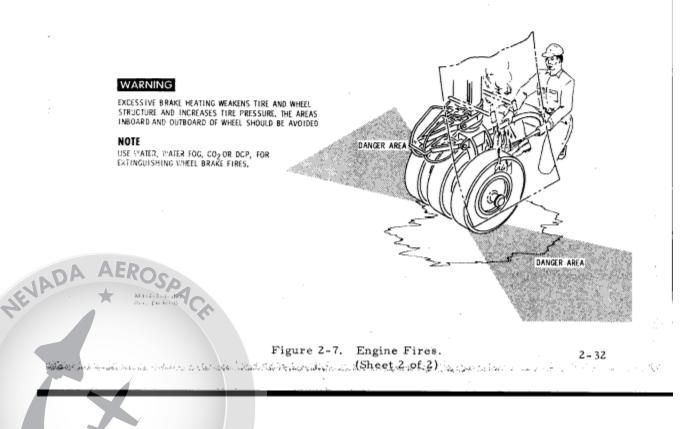

1 THROTTLE OFF.

)

HALL OF FAME

- 2 EMERGENCY FUEL SHUT-OFF (GUARD UP),
- 3 IF POSSIBLE MAINTAIN OPERATION UNTIL ALL EVIDENCE OF FIRE HAS DISAPPEARED. IF FIRE DOES NOT BLOW OUT OR PERSISTS DISCONTINUE START OPERATION AND FIGHT AS OIL FIRE BY APPLYING CO2 IN SHORT BURST INTO AFTERBURNER SECTION.

If available, use a portable ground air blower to accelerate cooling.

a. The aircraft should be towed to an isolated location, if possible, and brakes allowed to cool for a period of one hour or more.

b. Required personnel should approach overheated wheels with extreme caution in a fore or aft direction - never in line with the axle.

Wheel Brake Fires. (See Figure 2-7.)

송값

WARNING

Excessive brake heating tends to weaken

tire and wheel structure and increase tire pressure. The area inboard and outboard of

the wheel shall be avoided at all times.

Apply DCP, water or water fog to brake and wheel.

b. When removing wheels from aircraft deflate tire prior to

Salah da

removal.

HALL

2-42. Aircraft Walkways. (See Figure 2-8.)

2-43. A portion of the upper surface of the aircraft is suitable for

walking. Clean rubber soled shoes or shoe covers (wing sox) shall be worn by all personnel performing maintenance in these areas.

2+33 1. The Martin and Martin and Martin and Print and Strange and the

CAUTION

Scratches and dents' reduce structural strength and impair aircraft performance. Damage caused by careless walking or handling of tools can require extensive repairs.

2-44. Foreign Object Damage.

1000

JADA

HALL

OF FAME

2-45. Foreign object damage is an ever present hazard to the operation of gas turbine engines. It is the responsibility of all maintenance personnel to conscientiously adhere to and follow preventive procedures and policies to eliminate ingestion of foreign objects by gas turbine engines. Several areas of concern are parking and storage areas, maintenance areas and procedures, engine installation and engine ground operation. Frequent and periodic inspection of engine nacelles, inlet ducts and storage areas is recommended. When required, careful cleaning of areas should be accomplished. All maintenance personnel must exercise extreme care while performing maintenance procedures in and around the aircraft to prevent foreign object damage to the two turbejet engines. The greater size of the engines creates greater suction pressures and much larger suction areas. These higher suction pressures enable the engines to pull objects from greater distances into the intake ducts or the engine

2-35

a balan sa kalan kala

nacelle areas and on into the engines' compressor sections. Objects may be picked up from the deck areas or from other areas which are directly or indirectly open to the engine nacelle and inlet duct. Therefore, it is mandatory that personnel performing maintenance in and around the aircraft account for all tools, hardware and components after all maintenance procedures and operations.

2-46. Duct plugs and dust excluders are required to reduce foreign object accumulation. (See Figure 2-9.)

2-47. Parking and storage areas should be inspected for foreign objects. Such material shall be removed with brooms, sweepers or other suitable equipment.

2-48. General maintenance and structural repair procedures can contribute foreign materials for ingestion by gas turbine engines. The following procedures are designed to reduce these materials:

Every effort should be made to keep areas as clean as possible
 to minimize possible foreign object damage to engines.

b. All filings, metal shavings, pulled rivet stems, and debris must be removed from the areas and aircraft structure during and immediately after completion of work. The area should be cleaned of all spilled fluids.

E Rock in R 1

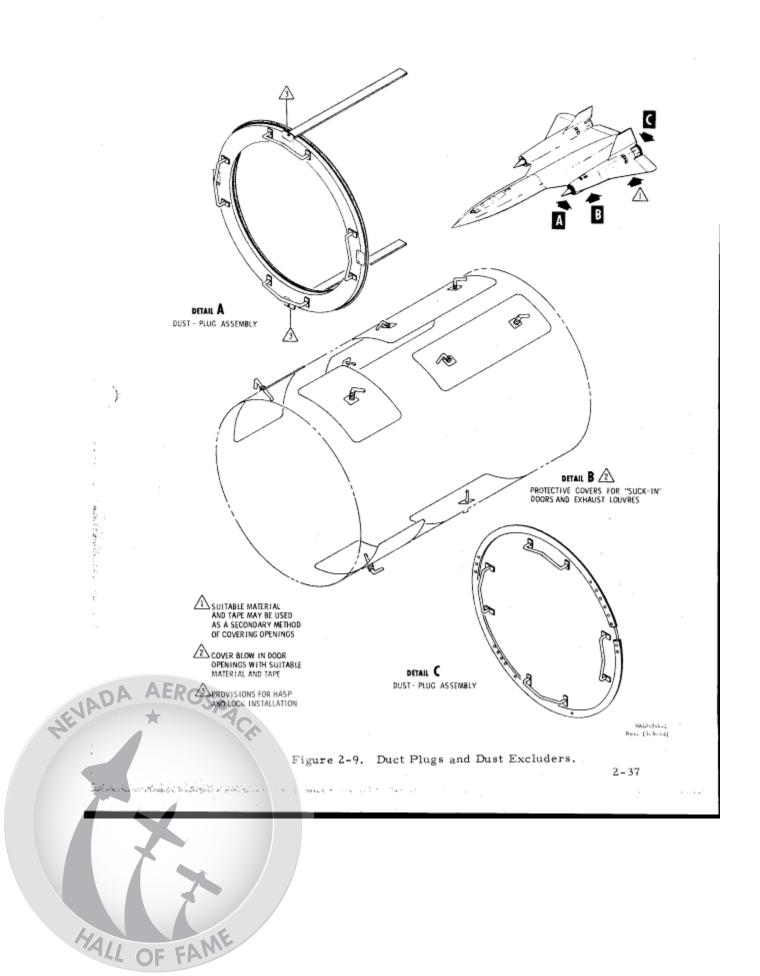

2-36

in the state of the state of the state of the

JEVADA

HALL OF FAME

And the Statistics Street Street, and a

c. All hardware items and tools should be accounted for during and after work completion.

d. Damaged items should be removed from the area immediately after their removal from the aircraft.

e. Items inadvertently dropped must be found immediately after being dropped.

f. All areas must be inspected for cleanliness prior to closeout with tape, panels or doors.

g. Ensure that close-out panels and doors are properly installed and enclose the designated area. Mismating of panels, cracks, and poor workmanship defeat the purpose of the panels and doors.

2-49. Health Hazards.

2-50. Liquid Nitrogen.

JADA

HALL

OF FAME

2.51. Extreme care must be exercised while servicing systems that require liquid nitrogen to prevent personnel injury. Protective gloves, which may be removed quickly, should be worn at all times while handling LN2. Personnel doing actual servicing should wear the gloves, rubber apron and a full face shield, as direct skin contact can result in extremely painful sores, which resemble burns. Also, symptoms of hypoxia can occur from prolonged contact with escaping GN2 in confined areas.

b. Face shield which will provide full face, neck and top of the head protection from frontal exposure.

c. Safety glass which will be worn under the face shield as an added precaution.

 A slicker type raincoat for body protection. An apron is not considered satisfactory.

2-56. The above protective equipment will provide the necessary time delay after a spill or splash to allow personnel to get away from the spill area.

WARNING

It is extremely important that barehanded work be prohibited. Personnel protective equipment must be considered as secondary equipment only. Adequate facilities, procedures, and authorized handlers provide primary protection.

2-57. If a fire results from a spill: in an enclosed area there is a possibility of a reduction in oxygen content in the air, and the fumes may be toxic; therefore, a suitable respirator must be used by personnel entering the area. Scott air paks respirators or air line respirators must be worn by personnel entering the area.

2-40

BARKARE 24 ARA AND S BARA STATISTIC AN AND A CONSTANT AND THE

JADA

HALL

OF FAME

2-52. Triethylborane (TEB).

2-53. TEB will cause serious thermal burns on contact with the skin. The burned area may provide a highly absorbent area for this compound; therefore, skin contact must be avoided. The inhalation of these compounds is extremely unlikely due to their pyrophoric characteristics; however, the fumes are toxic.

2-54. Personnel protective equipment must be worn at all times while doing any transfer, filling, installation, removal or maintenance work with pyrophoric contaminated equipment. All handling and transfer operations must be controlled to prevent leakage and personnel exposure to liquid, gas and fires. All equipment must be thoroughly decontaminated by the pyrophoric handlers before leaving their custody and a control tag system shall be used showing the status of all equipment where residue could be trapped. These liquids very often lay behind a blanket of combustion products in unpurged open lines. Proper purging of all equipment and lines is a must. Overflow or vent lines must be led off to a safe disposal area.

2-55. When handling TEB or units involving this material the following protective equipment or equivalent equipment must be worn at all times: a. Leather gloves which will give maximum protection and can

be thrown off quickly.

3-1. GROUND HANDLING.

3-2. This section provides the proper handling procedures, using approved equipment that is required to properly handle the aircraft during routine maintenance procedures. All safety precautions which provide for safe and efficient handling of the aircraft shall be strictly adhered to.

3-3. Center of Gravity Control.

CG is required.

IADA

HALL OF FAME

3-4. Accurate control of the CG of the aircraft during ground handling is required to prevent tipping the aircraft upon its tail. Some of the problems encountered which will move the aircraft CG aft are as follows:

 Maintenance personnel working aft of the main gear on top of the wing.

b. Parking the aircraft on a sloped ramp.

c. Sudden release of sticking shock struts.

d. Snow on the fuselage, nacelle and wing surfaces.

e. Uneven distribution of fuel in the tanks.

3-5. In order to safely perform all maintenance functions requiring removal of aircraft equipment and/or major removable components, in addition to towing or jacking, a specified ground handling gross weight and

3-1

a an ann a bhailte an the stand ann an an ann a bhailte an tha an tha an tha an tha an tha tha an the state

3-6. When major removable components and/or equipment are to be removed from an aircraft fully fueled, this weight and CG condition will allow the maximum removal of such components and equipment without damage to the aircraft during ground handling.

3-7. When major removable components and/or equipment are to be removed from an aircraft at its zero fuel weight, this weight and CG condition will allow the maximum removal of such components and equipment without damage to the aircraft during ground handling.

CAUTION

If the aircraft is partially fueled there shall be more fuel weight forward of the landing gear than aft of the landing gear. The aircraft can then be handled with any configuration of component/equipment removal.

Note

JEVADA

HALL OF FAME

During engine ground operation, transfer fuel to the number one tank as required to maintain the fuel weight forward of the landing gear.

3-2

3-8. Aircraft Anti-Tipping Prop. (See Figure 3-1.)

3-9. The anti-tipping prop is a safety device used to ensure aircraft stability when equipment is removed forward of the main gear location or when maintenance is being performed on the wing section of the aircraft.

CAUTION

The anti-tipping prop must be used at all times when the aircraft is resting on its in the landing gear in a normal ground attitude. The anti-tipping prop shall not be used under the following conditions:

a. While the aircraft is resting on jacks
 or being raised or lowered by jacks.

b. As a device to augment or replace the normal jacking equipment.

à

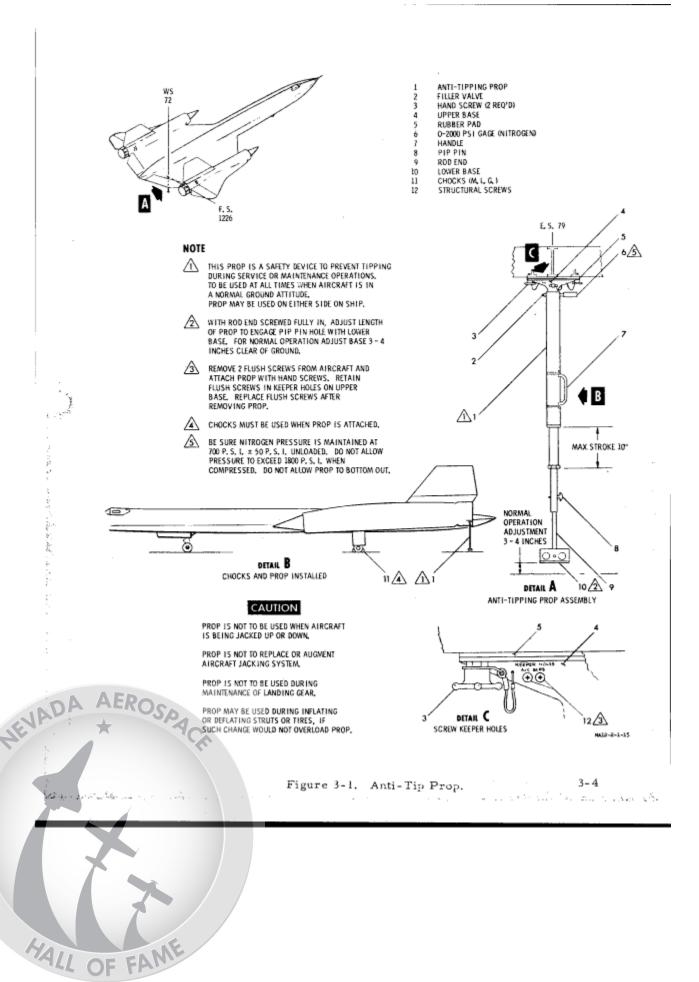

JEVADA

HALL OF FAME

c. When landing gear maintenance is performed which will change its geometry, unless it can be determined that such changes will not overload the prop assembly eg. inflating or deflating gear struts or tires.

3-3

and the second data and the second states of the second second second second second second second second second

3-10. Cockpit Entry.

3-11. Normal entrance into the pilet's cockpit is made by use of an approved external stand after the canopy is open. (See Figure 3-2.)

Note

Refer to Section II for emergency access to the cockpit.

CAUTION

Exercise extreme caution when positioning the external stands to prevent damage to the chine sections.

3-12. Aircraft Towing.

3-13. Limitations.

IADA

HALL

OF FAME

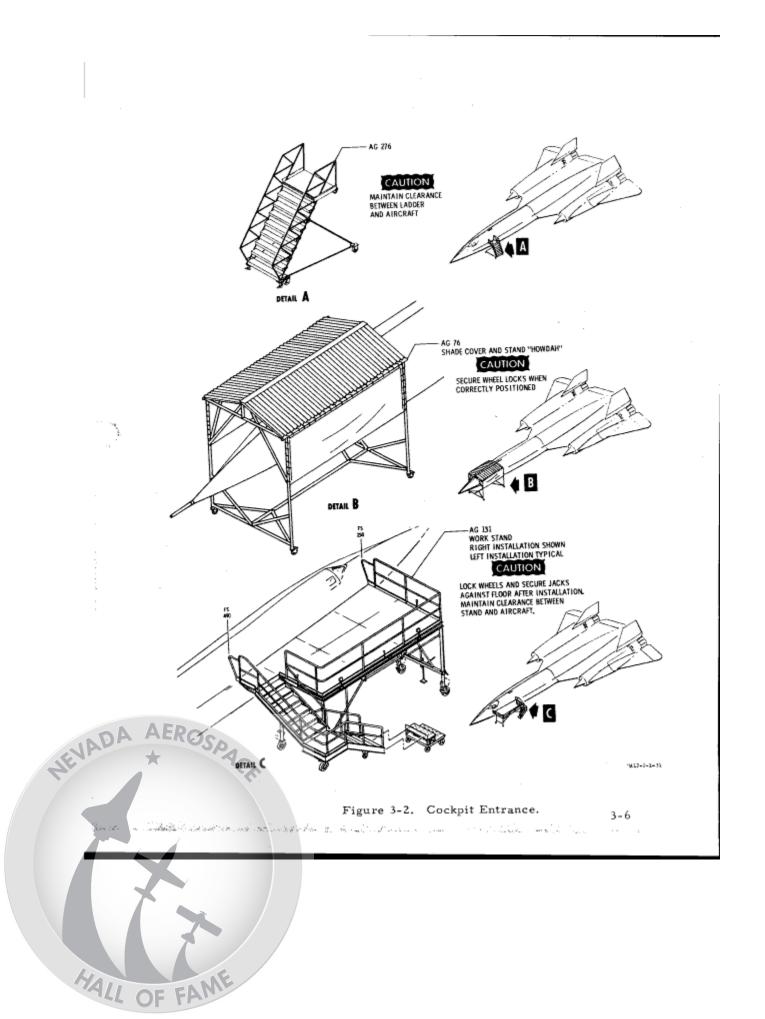

CAUTION

All towing from the nose gear shall be done by means of the nose gear tow bar AG-64.

a. The nose gear scissors shall be disconnected prior to any movement of the aircraft by towing.

b. The nose gear towing angle shall not exceed \pm 45 degrees from the aircraft longitudinal centerline. Pushing or pulling within this angle up to the maximum allowable gross weight is permissable on hard surface ramps ONLY and for short distances ONLY eg. moving aircraft in and out of the hanger.

القوها يمعقن المعصيرة وليأوف فأستن تناسيه فأخصيه فأخرا للسابي بالواحد اطرحمان الأليه تركيتها فالتهائل تشاقط الأكراب وارسه

CAUTION

Gross weight must be less than 60,000 pounds when towing long distances.

c. In an emergency it is permissable to pull or push on the nose gear tow bar when it is 90 degrees to the aircraft longitudinal centerline with one set of main gear wheels set, causing rotation of the aircraft about this pivoting main gear. Such movement is allowed ONLY on HARD SURFACES - USE EXTREME CAUTION!

d. The nose gear tow bar has built-in shear screws. If a towing condition arises whereby the shear screws fail, then the aircraft shall be towed from the main gears, using the applicable equipment and following the procedures under "Main Gear Towing."

e. Maximum towing speed shall not exceed ten (10) miles per hour.

HALL OF FAME

f. Sufficient personnel shall be available to ensure that adequate clearance is maintained between other aircraft building, and vehicles and the aircraft while it is being moved.

g. No aircraft braking shall be used during the towing operation. The only brake pressure available would be from the brake accumulator and it may be <u>discharged</u>.

3-14. Nose Gear Towing Procedure. (See Figure 3-3.)

 Disconnect the nose gear scissors and secure the bolt and nut to the upper link.

b. Support the upper scissors link by a suitable strap from the nose gear safety lock pin. The lower scissors link is supported by the static ground strap bracket.

c. Attach the AG-64 Tow Bar to the nose gear.

d. The aircraft is now ready for towing provided all leads,
 lines, etc. are released.

CAUTION

Observe all limitations listed under paragraph 3-13.

3-15. Main Gear Towing Procedures. (See Figure 3-4.)
3-16. When towing forward or turning from the main gear wheels, under severe conditions, the following procedures shall be used:

 $e_{i} \geq 0$

JADA

أخلا تحاء و

HALL

OF FAME

a. Attach the strut clamp assemblies of AG-120, placing the one inch retaining bolts through the appropriate holes of AG-148 Tow Strap into the top pivot shaft of the upper scissors link. Finger tight is sufficient for the bolts.

b. Attach approved cables and clevises between the tow strap and the towing vehicle(s).

Some the Section Courses

There are no provisions for a parking brake. Prior to aircraft movement the brake accumulator charge may be checked by viewing the pressure gage located in the right main wheel well.

Note

h. The aircraft is <u>not</u> designed for stopping reaction forces while moving in the aft direction. Therefore, wheel chocks <u>shall not</u> be dropped behind the main wheels and used as dynamic stopping devices.

117

i. There are no restrictions on using chocks as dynamic stopping devices while the aircraft is being towed forward.

ĩ

JADA

HALL

OF FAME

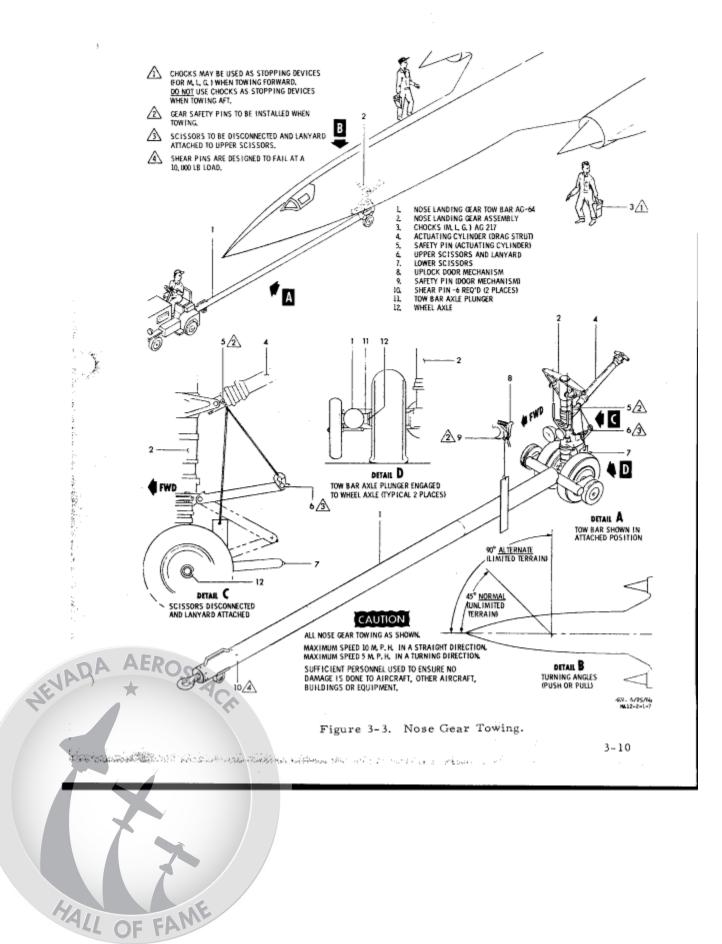

j. One person shall be stationed at each main wheel during the towing operation. Each shall be provided with an approved chock to be used as necessary consistent with items h and i.

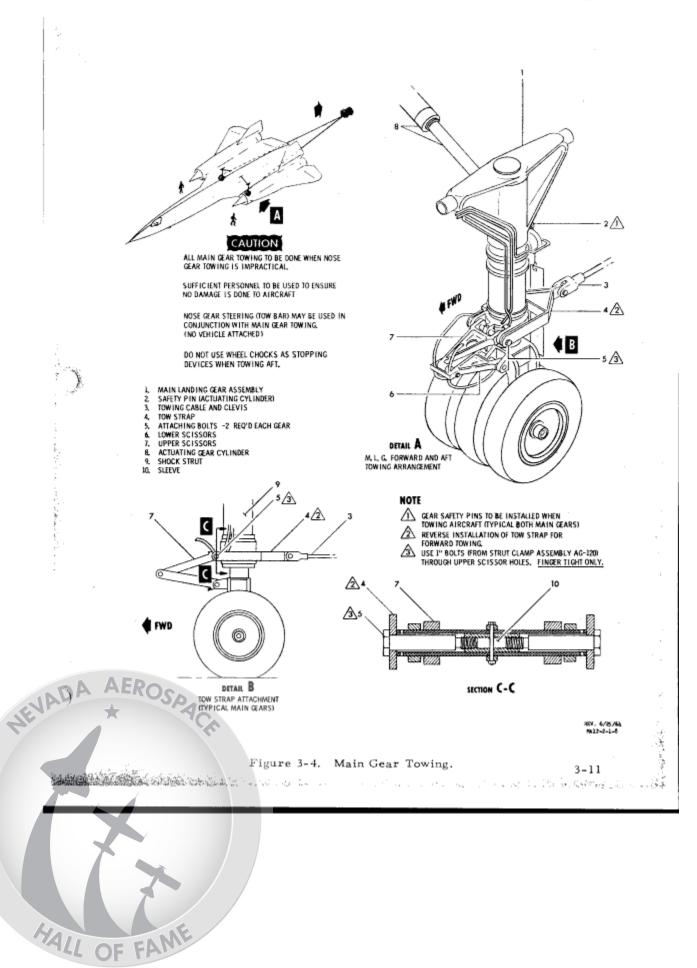

k. When the strut clamp assembly of AG-120 and Tow Strap AG-148 are used during main gear towing, there are no gross weight or terrain limitations on towing the aircraft.

 All gear struts shall be pressurized for towing. The nose gear strut shall be adjusted, if necessary, so that a <u>maximum</u> of 12 inches of piston is exposed.

3-8

Contractor Contract States and States and

c. If necessary, the nose gear tow bar, AG-64 or TAG-64, may be attached and used for steering as required. <u>Disconnect</u> the nose gear scissors before towing.

en la mora de la companya da companya

d. Pickup the load with the tractor(s) as smoothly as possible in order to keep the dynamic loads at a minimum.

CAUTION

Observe all limitations listed under paragraph 3-13.

3-17. When towing aft from the main gear under severe conditions the following procedures shall be used:

a. Attach Tow Strap AG-148 onto the main gear using the one inch bolts from AG-120 Clamp.

b. Attach approved cables and clevises between the towing vehicle(s) and the tie-down lug on Tow Strap AG-148.

c. Both main gear may be pulled on from a single tractor positioned symetrically behind the aircraft about 70 feet from the main gear location. Two tractors may also be used, one per gear, pulling straight aft.

3-24.

3-20. Aircraft Mooring and Run-Up Tie-Down Provisions. (See Figure 3-5.)

3-21. <u>Hoisting Provisions After Wheels Up Landing.</u> (See Figure 3-6.)
3-22. Prior to installation of hoisting equipment the cockpit seat and
rail assembly will require removing.

WARNING

Deactivate all ballistics by disconnecting lines

or sever all lines with shears.

Aircraft Jacking Procedure.

Limitations - Jacking.

a. A maximum gross weight of 117,000 pounds shall be adhered to when jacking any or all landing gear for purposes of changing a tire, wheel or brake assembly. All wing panels and latches shall be secured and the nacelle closed and secured.

5

CAUTION

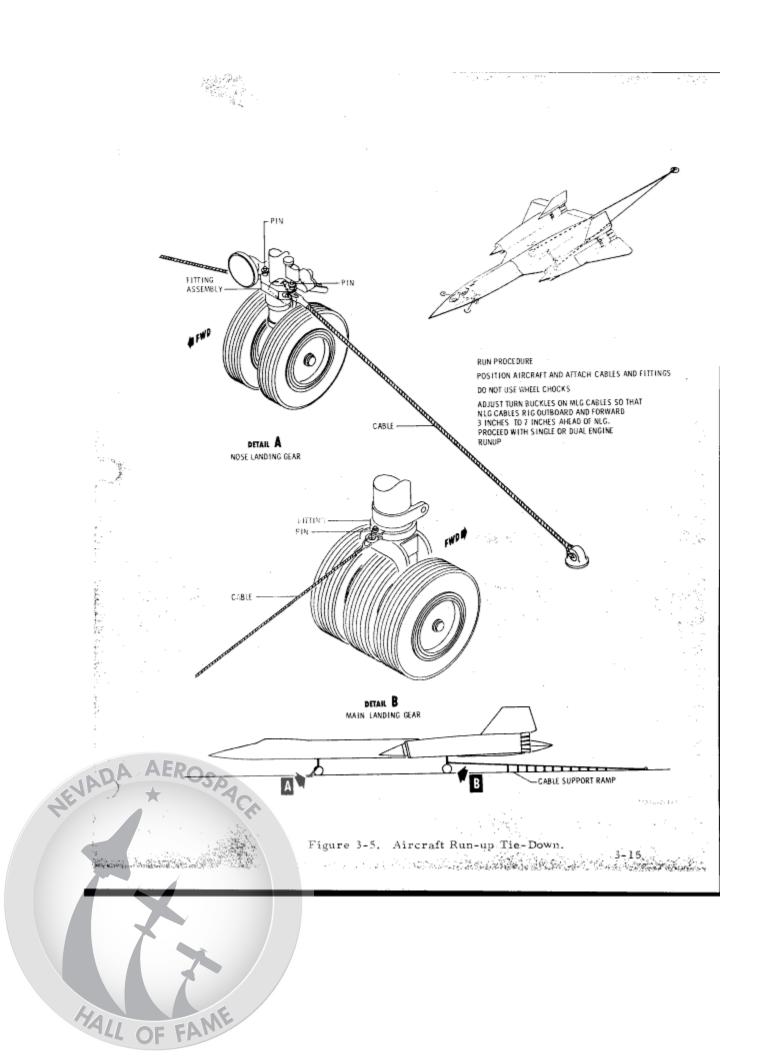

There shall be no jacks used on the fuselage

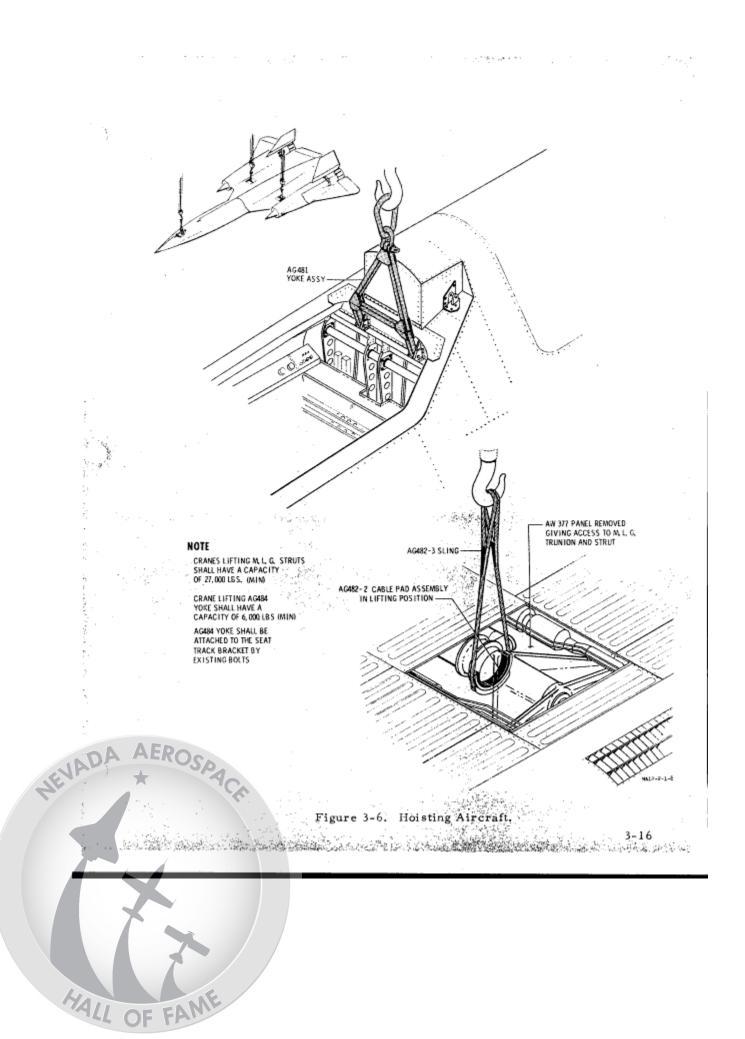

3-14

or wing jack points at this gross weight.

(117,800 lbs.)

2.12

b. A maximum gross weight of 68,000 pounds shall be adhered to when jacking the aircraft using wing and/or fuselage jacks. The nacelle and wing shall be closed and properly secured.

(14.139) A.A.A.A.

c. The maximum gross weight that shall be adhered to when jacking the aircraft using wing and/or fuselage jacks when either or both nacelles and wings are open shall be the <u>zero fuel</u> weight of the aircraft.

Structural Limitations.

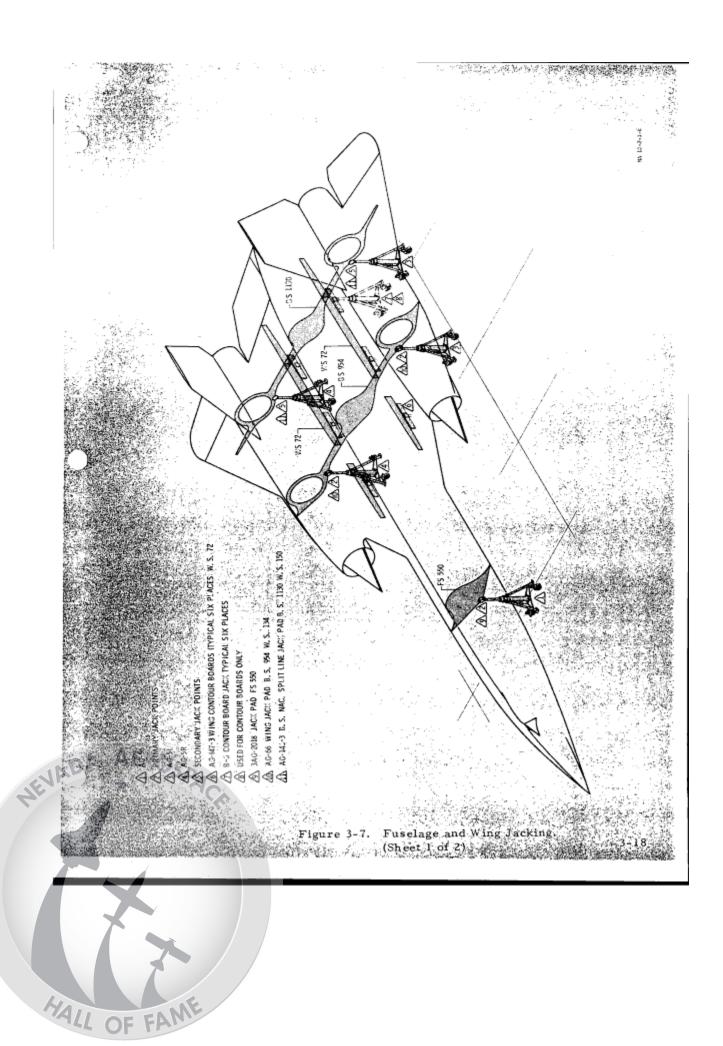

3-25.

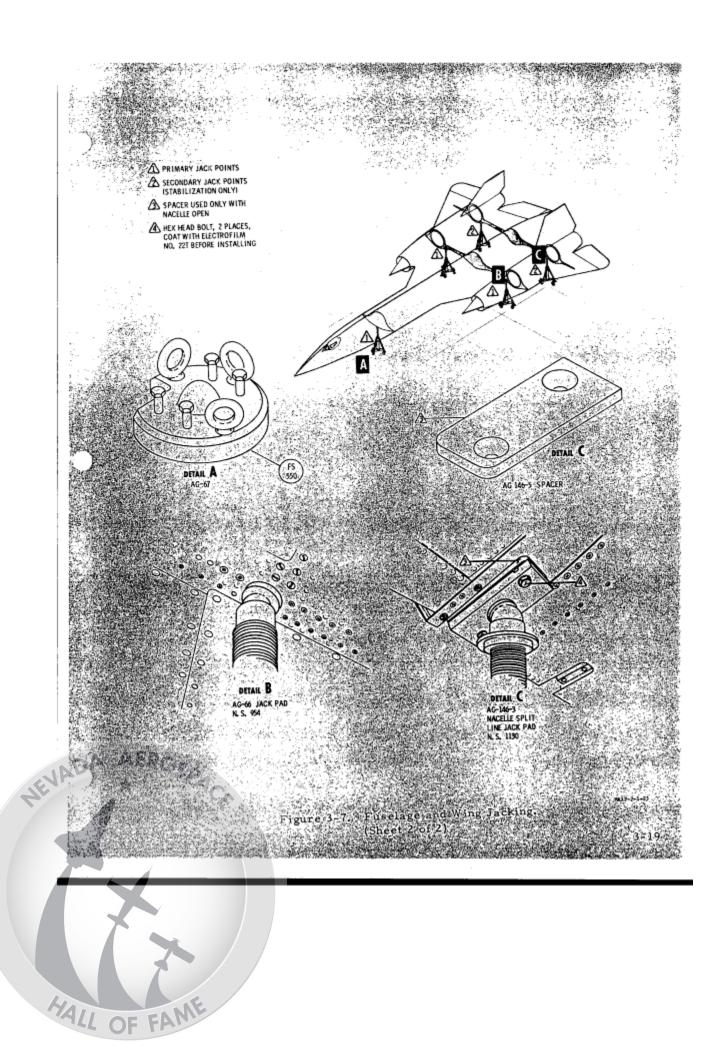

HALL OF FAME

a. Inboard Wing Panels - The removal of inboard wing panels shall require aircraft gross weight to be at the zero fuel weight <u>or less</u> and that all fuselage, wing jack and contour boards are in position and adjusted prior to removal of <u>any</u> inboard wing panel.

b. Tires - If the aircraft is to remain idle for a period exceeding three days, all wheels shall be rotated one-third at the end of each 48 hour period so as to change complete ground contact area of the casings. As an alternate, the aircraft may be jacked up at a height sufficient to relieve casing load.

3-26. Fuselage and Wing Jacking Procedure. (See Figure 3-7.)
 a. There are five Jack pads, three primary and two secondary, which require attachment to the aircraft.

b. Position all five tripod jacks under their respective jack pad location. Operate the forward fuselage, left and right wing jacks (primary) so that the aircraft is raised smoothly and uniformly until all aircraft weight is supported by these three jacks.

c. Extend both secondary jacks until their wheel springs are compressed and all jack feet rest securely on the floor. Extreme care must be exercised so that these jacks are not relieving the primary jack loads. The function of both secondary jacks is that of support only.

CAUTION

If work is contemplated within engine nacelles, it will be necessary to raise the outer nacelle and wing half prior to installation of the secondary jacks.

If it is decided to open the nacelle and wing half while; the aircraft is on jacks, it is permissable to temporarily remove both secondary wing jacks and pads. However, install Spacer AG-146-4 under AG-146-3 Jack Pad Base when replacing the jacks.

3-27. Contour Board Installation.

a. Position centour stand under each wing, spanning the designated beam stations along wing station 72. Raise the contour boards

until they are firmly in place and secure in this position.

CAUTION

Shim jack feet as required to ensure side

clearance between the jack screw and socket cellar of the contour beard.

3-28. Contour Boards, Jacks and Jack Pads Removal.

1-29 All contour boards, jacks and pads shall be removed in the following order. All inboard wing panels shall be in place before removing fuselage or wing jacks.

a. All six contour boards shall be removed first;

b. Left and right secondary jacks shall be removed after temoval of all contour boards.

c. All three primary jacks shall be smoothly and uniformly lowered until all aircraft weight rests entirely on the landing gear.

d. All jack pads shall be removed and the areas cleared of all equipment.

3-21

3-30. Jacking Procedure - Landing Gear Jack Points. (See Figure 3-8 & 3-9

 Position specified gear jack under built-in jack points on the gear\$) desired to be raised.

CAUTION

At high gross weights, sufficient footing shall

be provided under the jack feet to ensure that

the aircraft is raised and that jacks are not forced down into the ground or floor.

Note

Should the tire spread prevent installation of the AG-49 Jack Beam, it will be necessary to relieve tire loads by reducing gross weight to 68,000 pounds.

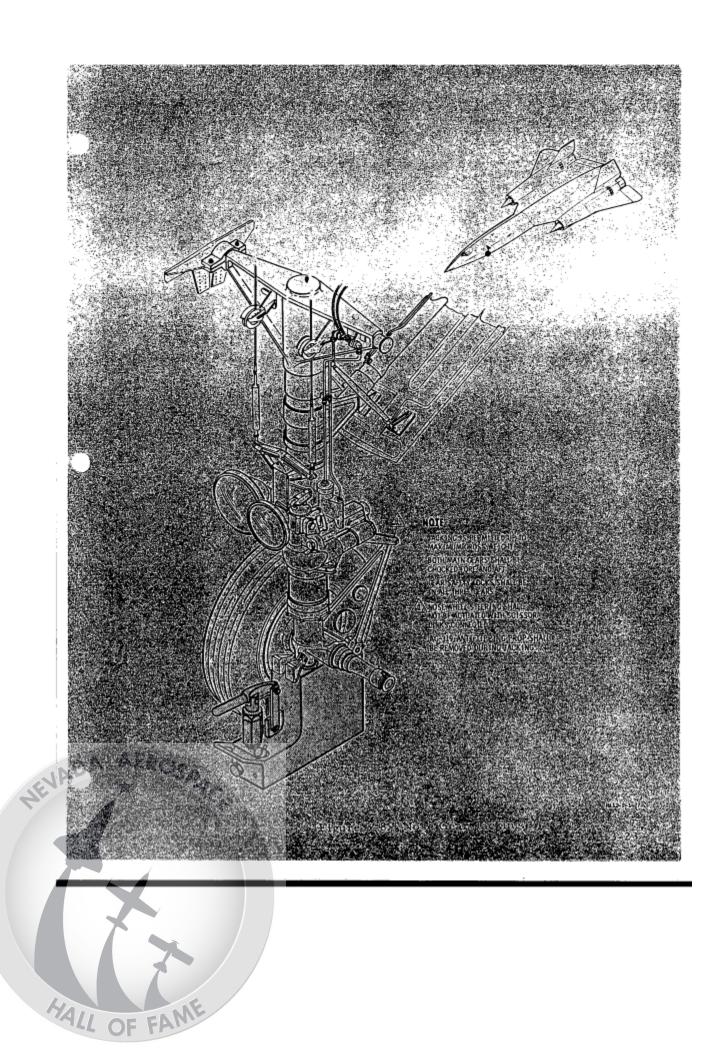

b After all required maintenance has been completed, slowly and smoothly lower landing gear wheels down on to the floor and remove all jacking equipment.

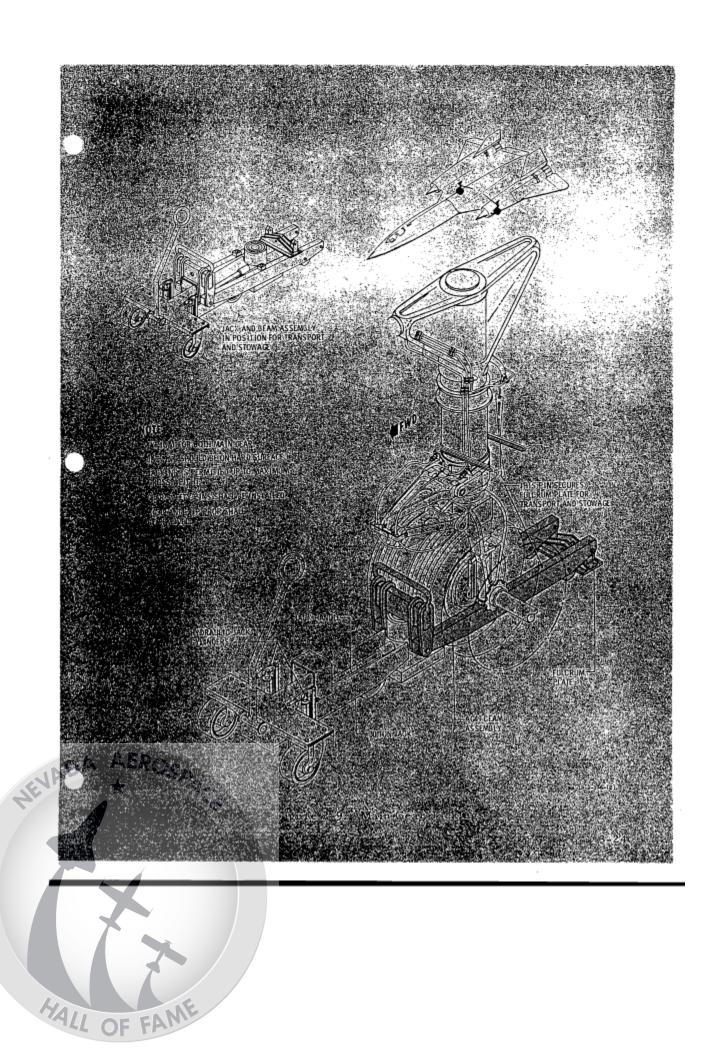

Deceleration Parachute Handling,

HALL OF FAME

3-32. The aircraft is equipped with a deceleration parachute system which is used as a supplement to the aircraft brakes. It is used to reduce rollent distance during an aborted take-off or after a landing.

3-22

Normally a crew of three mea with a suitable vehicle will be required to retrieve the deceleration parachute after it has been jettlebued. The deceleration parachute assembly will be gathered up and placed in a suitable container to keep it clean and protect it from snagging on tearing.
